Abstract

The present study was conducted to assess the socio-economic profile and association between independent variables with knowledge of the banana growers in Vaishali district, Bihar. The study used purposive sampling to select two blocks, namely Hajipur and Bidupur, and simple random sampling to select three villages from each block. In total, six villages were selected for the study, and a total sample of 120 banana growers was chosen using proportionate simple random sampling technique. The study employed path coefficient analysis to measure the effect of the independent variables on knowledge. The finding inferred that the socio-economic profile of the respondents were medium level. There was a significant and positive correlation between the level of knowledge regarding improved banana cultivation practices and the variables of age 0.970725, annual income 0.962013, source of information 0.787561, scientific orientation 0.966084, risk orientation 0.840664, mass media exposure 0.947871 were positive and highly significant relationship with the level of knowledge of improved banana cultivation practices. (Significant at 0.01% level of probability). On the other hand, extension contact 0.291774 positive and significant association with the level of knowledge toward improved banana cultivation practices (Significant at 0.05 % level of probability). While education, caste, type of family and size of land holding are non-significant association with knowledge of banana growers about improved banana cultivation practices.

Key words : Association, Knowledge, Personal profile, Banana cultivation.

India has always relied heavily on agriculture for its economy, and it remains a central part of rural life despite the industry's growth in recent decades. As reported by the Food and Agriculture Organization (FAO) of the United Nations, in 2019, India was the world's second-largest producer of fruits and vegetables 2019. India ranks second after China in overall fruit production but is the world's largest producer of mangoes (39%), bananas (29%), papayas (38%), limes, and lemons. Bananas are the most popular fruit in the world and are the primary fruit in international trade. India leads the world in banana production, producing an annual output of 33.06 million tonnes in 2020-21. In terms of export volume, bananas rank first and second in value after citrus fruits. The average productivity of fruits in India has increased from

10.72 million tonnes per hectare during 2001-2002 to 11.87 million tonnes per hectare during 2010-11 (PIB, 2021).

Horticulture contributes 29.65 per cent to the gross domestic product (GDP) from 13.5 per cent area out of the 18.5 per cent contribution from Indian agriculture to GDP. It has proved beyond doubt its potential for gainful diversification (Sujatha *et al.* 2012). Economic gains are progressively becoming knowledge-based activities and are getting globalized faster, which can be achieved through adopting advanced technologies (Kakodkar 2017). One of the significant developments is that horticulture has moved from rural confine to commercial production, and this changing scenario has boosted the horticulture industry. Cultivation and utilization of horticultural crops play a key role in raising the prosperity of India and are linked

with the health and happiness of its people (IIHR 2014). Bananas play an important role in the socio-economic and cultural life of a rural community in addition to their economic value, nutritional value, and the diverse uses of the fruits (Hapsari 2011; Hapsari *et al.* 2015, 2017).

The Vaishali district in Bihar has a significant presence of banana cultivation, with a total cultivated area of 3402 ha and production of 142083.53 MT in 2017-18, according to the Bihar Horticulture Development Society, 2018. This data shows that the cultivated area and production have remained relatively stable over the past few years, with a cultivated area of 3400 ha and production of 142000 MT reported in 2014-15. This suggests that banana cultivation in the Vaishali district is consistent, and the farmers can maintain their production level over the years.

Methodology

The study was carried out in the northern Indian state of Bihar's Vaishali district. This region is well-known for having rich soil and a climate that are conducive to agricultural endeavours. Out of the several crops grown in the Vaishali district, banana growing has become an important economic driver. Banana farming is a prominent industry in the district, according to the Bihar Horticulture Development Association, with a total cultivated area of 3402 hectares and production of 142083.53 metric tonnes in the year 2017-18.

A descriptive research design was followed for the present study. Hajipur and Bidupur, two of the 16 blocks in the Vaishali district, were purposively selected because they have the maximum number of farmers involved in banana cultivation. Bidupur block comprises 133 villages, whereas Hajipur block includes 212 villages, and three villages were selected from each block, making a total of six villages that

Table 1. Socio-economical characteristics of the respondents

Variables	Frequency	Percentage
Age		
Young (18-35)	12	10.00
Middle (36-55)	75	62.50
Old (56 and above)	33	27.50
Caste		
General	73	60.83
Other backward class	47	39.17
Family type

Medium (7)	48	40.00
High(8)	19	15.83

were randomly selected. A total number of 120 respondents were selected for the present study. The data were collected using a personal interview schedule.

Results and Discussion

Significant disparities were observed between the pre-hypothetical framework and the study's post-observation, which can be attributed to the many qualitative and quantitative characteristics displayed by the communities that banana growers in the study areas.

The study revealed that 62.50 per cent of the respondents belonged to the middle-aged group, The maximum number of respondents were belongs to general caste (67.50%) and majority are nuclear family type (61.67%). The majority of respondents (59.17%) belonged to literate. Similar finding was reported by Malarkodi, et al. (2020). It was also found that occupation (87.50%) are totally on agriculture, the majority of the respondents (58.33%) had a medium annual income, 47.50 per sent belonged to marginal land holdings, and the 72.50 per cent belonged to the high level of mass media exposure. Majority of the respondents are having a medium level of risk orientation (50.83%), scientific orientation (51.67%), and source of information (74.00%). The majority of respondents (80.00%) are having a low level of extension contact. Similar finding was also reported by Medhi (2021).

Level of Knowledge of the respondents

: The data presented in Table 2 indicated that 49.17 per cent of the respondents had a mediam level of knowledge about banana cultivation practices. A significant proportion of banana farmers, approximately (26.17%), had a high level of knowledge, while (24.17%) of the surveyed farmers had a low level of knowledge about banana cultivation practices. Similar finding was reported by Chaudhari and Chauhan (2017).

Independent variables namely age (0.970725), annual income (0.962013), source of information (0.787561), scientific orientation (0.966084), risk orientation (0.840664), mass media exposure (0.947871) were positive and highly significant relationship with the level of knowledge of improved banana cultivation practices. (Significant at 0.01% level of probability). On the other hand, extension contact (0.291774) positive and significant association with the level of knowledge toward improved banana cultivation practices (Significant at 0.05 % level of probability). While education (0.080507), caste (0.073609), type of family (0.048596) and size of land holding (0.00502) are non-significant association with knowledge of banana growers about improved banana cultivation practices.

Table 2. The distribution of respondents as level of knowledge

Knowledge level	Frequency	Percentage
Low (upto 56 score)	29	24.17
Medium (57-60 score)	59	49.17
High (61-64 score)	32	26.66
Total	120	100.00

[Standard deviation = 3.89]

Table 3. Correlation coefficient (r) between different Independent variables and Knowledge about improved banana cultivation practices

Independent Variable	Correlation coefficient
Age	0.970725*
Education	0.080507 NS
Caste	0.073609 NS
Annual income	0.962013*
Type of family	0.048596 NS
Size of land holding	0.00502 NS
Source of information	0.787561*
Scientific orientation	0.966084*
Risk orientation	0.840664*
Mass media exposure	0.947871*
Extension contact	0.291774**

[NS = Non-significant; * = Significant at 0.01 %; ** = Significant at 0.05 %]

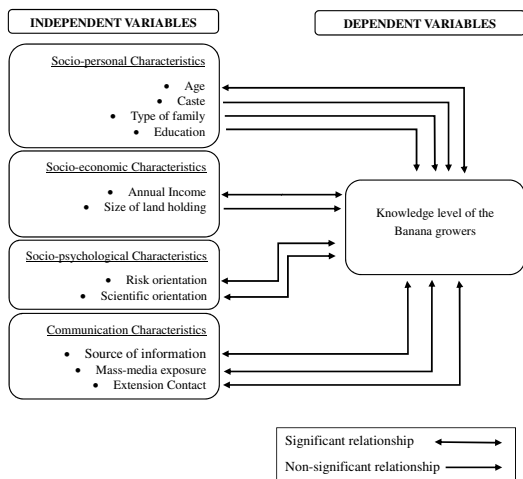

Fig. 1. Conceptual model of study.

Conclusion

It was concluded that majority of the respondents (62.50%) are middle-aged, medium income (58.33%), marginal land holdings (47.50%), high media exposure (72.50%). Majority have medium risk and scientific orientation (50.83% and 51.67%) and source of information (61.67%), 55.00 per cent have medium level of knowledge about improved banana cultivation practices. Age, annual income, source of information, scientific orientation, risk orientation and extension contact positively significant relationship with knowledge at (0.01%) probability. Government should formulate the appropriate extension strategy to increase the knowledge and adoption behaviour of farmers towards improved banana cultivation practices.
